Table 3: Counties With 5,000 or More Nonwhites, 1970 and 1980, by Age, Sex, and Color	34

This study contains net migration estimates on the state and county level for the years 1970 to 1980.[1] Migration estimates for the total population by five-year age groups and by sex are presented for all counties. In addition, for those counties with nonwhite populations of 5,000 or more persons in both 1970 and 1980, the estimates are presented by color—white and nonwhite. This data is contained in Tables 1, 2, and 3 of the Appendix. Included in the narrative text are tables showing historical migration estimates for the state and its planning and development districts.

The narrative presents an analysis of migration on the state, county, and planning and development district levels and an explanation of the methodology used.

Net Migration for the State

Historical Data

Arkansas' 1970 to 1980 net inmigration experience shows that a significant change occurred in the migration pattern relative to that of the three previous decades—from a net outmigration of 416,000 persons during the forties to a net inmigration of 231,467 persons during the seventies.[2] The state actually experienced an increase in net outmigration during the fifties (see Table 1), but the trend began to reverse itself during the sixties.

Color

In the 1970 to 1980 inmigration total, whites accounted for a net inmovement of 239,834 persons with a migration rate of 14.7 percent and nonwhites a net outmovement of 8,367 persons with a migration rate of 2.1 percent. Since the sixties, whites have shown a net inmigration to the state while nonwhites have continued to show a net outmigration but at a much lower level and rate during the seventies than in the three previous decades.

Age

Table 2, which presents historical migration estimates (1950 to 1980) by color for six major age groups, shows that the state experienced net outmigration in each of these age groups, except for the 65-and-over group, from 1950 to 1960. However, during the sixties when the outmigration trend began to reverse itself, only three age groups (0 to 4, 5 to 19, and 20 to 29) experienced a net migration loss. For the 1970 to 1980 period, the 20 to 29 year old age group (the group that usually experiences the highest level and rate of outmigration and did so for the 1950 to 1980 period) was the only one which continued to show a net migration loss. This loss was the result of the net outmigration of 9,738 persons in the 20 to 24 age group. While this loss was shared by both males and females (see Appendix Table 1), the male net outmigration

TABLE 1

Source: The 1940-1950 estimates are from the U.S. Bureau of the Census, Current Population Reports, Series P-25, No. 247, *Estimates of the Components of Population Change by Color, for States: 1950 to 1960:* 1950 to 1960 and 1960 to 1970 estimates were derived by the Industrial Research and Extension Center, University of Arkansas, Little Rock; 1970 to 1980 estimates were derived by the Demographic Research Division, Center for Research and Public Policy, Research and Public Service, University of Arkansas at Little Rock.

[1]Net migration is computed as the difference between the actual population and the expected population at the end of a specific time period. Expected population is the population at the beginning of the period plus the natural increase (births minus deaths) for that period. The migration rate was computed by dividing the net migration by the expected population.

[2]Net inmigration has occurred when the actual population is larger than the expected population. Net outmigration has occurred when the actual population is smaller than the expected population.

(8,824 persons) was about ten times that for females (914 persons).

and color, while Figure 2 emphasizes changes in the net migration pattern by decade.

Source: 1950 to 1960 and 1960 to 1970 data derived by Industrial Research and Extension Center, University of Arkansas, Little Rock; 1970 to 1980 data derived by Demographic Research Division, Center for Research and Public Policy, Research and Public Service, University of Arkansas at Little Rock.

For whites, the 1950 to 1960 data show net outmigration in each of the age groups, except the 65-and-over group, with the 20 to 29 year olds having the largest number of outmigrants. However, from 1960 to 1970, the period in which whites experienced a significant decline in the number of outmigrants, only the 0 to 4 and 20 to 29 year olds were still showing a net migration loss. Again, the 20 to 29 year olds had the largest number of outmigrants. By the end of the 1970 to 1980 decade, whites were experiencing net inmigration for all age groups.

The net outmigration for nonwhites was not reversed as rapidly as that for whites. For the periods from 1950 to 1960 and 1960 to 1970, there was net outmigration in all six age groups. The 5 to 19 age group had the largest number of outmigrants during the fifties; however, during the sixties, this was true of the 20 to 29 year olds. This age group also experienced the least significant drop in outmigrants during the 1960 to 1970 decade and continued to show a net outmigration, along with the 0 to 4 year olds, during the seventies. However, as shown in Table 2, the number of outmigrants in the 20 to 29 age group during the seventies had dropped to about half of its 1960 to 1970 total.

Figures 1 and 2 show graphically the changes in net migration trends by decade since 1950. Figure 1 emphasizes net migration changes by age group

Sex

While they are similar, net migration rate patterns (both in- and out-) for males continue to be somewhat higher than those for females for the state and most of the counties, regardless of color (see Appendix Table 1). This observation also holds for most of the sex distribution patterns by age groups.

Net Migration by County

Table 3 shows that 56 of the state's 75 counties experienced net inmigration from 1970 to 1980. Only 19 counties experienced net outmigration for the same period compared to 41 during the sixties and 74 during the fifties.

Seventeen counties (about 23 percent of the 75 counties) experienced net inmovements between 1970 and 1980 of more than 5,000 persons and accounted for a total of 191,499 inmigrants or about 82.7 percent of the state's net inmigration. These counties and their net inmigration totals are the following: Benton, 25,139; Pulaski, 20,839; Garland, 16,713; Washington, 16,362; Saline, 13,806; Baxter, 12,490; Faulkner, 11,923; Sebastian, 9,724; White, 9,045; Crawford, 8,926; Pope, 8,166; Craighead, 7,435; Independence, 6,484; Cleburne, 6,452; Sharp, 6,385; Boone, 5,829; and Lonoke, 5,781.

NOTE: The migration totals by county for whites and nonwhites will not add to the state totals shown in Appendix Table 1, since estimates by color were not calculated for all counties. In those counties which show only a total estimate, white and nonwhite numbers were combined to compute the estimate. However, the state totals by color shown in the Appendix were calculated using actual white and nonwhite numbers.

Source: Compiled from Appendix Tables 2 and 3.

Those counties which had net migration losses of 1,000 or more persons were the following: Mississippi, 9,623; Phillips, 8,988; Lee, 4,930; Crittenden, 4,582; St. Francis, 3,617; Monroe, 2,382; Chicot, 1,749; Jefferson, 1,637; Ouachita, 1,603; Poinsett, 1,554; and Cross, 1,310. The added total for all of the 19 counties which experienced net outmovements was 45,556 persons. The 11 counties just listed accounted for 41,975 persons or 92.1 percent of that total. The losses in Mississippi and Phillips counties together accounted for 18,611 persons or 40.9 percent of the total.

Forty-two counties had higher net inmigration rates than the state's (11.4 percent). Baxter County had the highest net inmigration rate (83.7 percent), and Benton County had the largest number of inmigrants (25,139 persons). Lee County had the highest net outmigration rate (24.1 percent) with Mississippi County having the largest number of outmigrants (9,623 persons).

Figure 3 is a county map showing net migration gain or loss by number of migrants, and Figure 4 shows net migration percent gain or loss by county and planning and development district.

County Migration Estimates by Color

As previously mentioned, net migration estimates by color (white and nonwhite) were computed for those counties having nonwhite populations of 5,000 or more persons for both 1970 and 1980. Table 3 contains net migration estimates for these counties.

Eighteen counties fell into this category. Of these 18 counties, 13 experienced net outmigration, and ten of these experienced net outmigration for both whites and nonwhites. The nonwhite portion of the net outmigration was larger numerically and higher relatively than that for the whites in nine of these ten counties (see Table 4). (It may be interesting to note that the nonwhite population comprised over 40 percent of the 1970 and 1980 county populations in each of these counties except Ouachita.) Mississippi County alone failed to follow this pattern with 70.3 percent of its net outmigration accounted for by whites.

Five of the 18 counties with nonwhite populations of 5,000 or more for both 1970 and 1980 experienced net inmigration, and four of these 18 counties (Garland, Miller, Pulaski, and Hempstead) showed net inmigration for both whites and nonwhites. The most significant observation to be made from this group of counties is that in Pulaski County (the state's most populous) the nonwhite net inmigration of 14,211 persons was 68.2 percent of the total of 20,839 inmigrants compared to a net inmigration of 6,628 persons or 31.8 percent for whites.

In the 18 counties, Lee County had the highest net outmigration rate (29.0 percent) for nonwhites, followed by Phillips County (23.5 percent) which had the largest number of nonwhite outmigrants (5,751 persons). Pulaski County had the highest nonwhite net inmigration rate (19.8 percent) and

Loss	-1,310	to	-9,623

the largest number of inmigrants (14,211 persons) for nonwhites.

Planning and Development Districts

Figure 1 of the Appendix is a state map showing the boundaries of the eight planning and development districts and their component counties.

Of the eight planning and development districts, only one (the East) experienced net outmigration between 1970 and 1980 compared to three (3) during the sixties and all eight (8) during the fifties. For the 1970 to 1980 period, four of these districts had net migration rates higher than the state's (see Table 5).

Three districts (Northwest, Western, and West Central) experienced no outmigration in any of their component counties and provided over one-half (143,118 persons) of the net inmigration for the state. The Northwest Planning and Development District (PDD) had the highest net inmigration rate (34.2 percent) and the largest number of inmigrants (72,027 persons) and provided almost one-third (31.1 percent) of the state's net inmigration.

Of the five remaining districts, the East and Southeast had the highest percentage of counties with net outmigration. The East PDD had seven out of 12 counties (58.0 percent) with net outmigration, and the Southeast had six out of ten (60.0 percent). The East was the only district to show net outmigration for the 1970 to 1980 period.

Methodology

The residual migration method was used to compute the net migration estimates. Using this procedure, net migration is calculated as the difference between actual and expected populations for a given time period. Expected population is the population at the beginning of the time period plus the natural increase (births minus deaths) for that period.

Survivorship factors were applied to the beginning population to derive the expected population by five-year age groups. A survivorship factor represents that proportion of the population of a specific age group at a given time that is expected to survive to a specific future point in time. Adjustments were made so that the resulting age-specific death estimates equal the actual death counts.

Net migration rates were calculated by dividing the net migration by the expected population.
